Affirm Hiring Team

Affirm

Remote, US

Dear Affirm Hiring Team,

I am excited to apply for the Senior Software Engineer, Backend role on the Merchant & Partner Lifecycle team. Affirm's bet on honest, transparent credit only holds up if the systems behind it stay reliable as merchant volume grows, which is the backend work I have spent my career on. Consolidating merchant lifecycle orchestration into one cohesive domain is exactly what I do, designing event-driven services that stay correct under scale. As a Senior Software Engineer with 13+ years in Kotlin and Java, I would bring that to the new lifecycle-orchestrator service.

At Intuit I own a fault-tolerant fulfillment subsystem that ingests events from four sales channels at hundreds of thousands of events per day, where ordered delivery and idempotency are core design constraints, since each event must link to its upstream product and variant entities before downstream inventory consumers can act. I scaled it to sustain 75 TPS through database partitioning, sharding, and load-based autoscaling. That is the same shape of problem as orchestrating merchant lifecycle across connected systems, and it is exactly where Domain-Driven Design and event-driven architecture earn their keep.

Before Intuit, at TriNet I built a core SSO microservice serving roughly 400,000 customers across about 20 cloud provider integrations. I paired it with an ACL-based authorization service consumed by 20 microservices, backed by a two-tier cache that removed per-request database round-trips and measurably reduced p90 latency. Coordinating that many dependent services taught me to align contracts and scope across teams before writing code, which is the cross-team execution this role asks for.

On agentic tooling, I recently shipped a production multi-agent AI onboarding assistant on LangGraph and GPT 4.1, building a config-driven intent orchestrator that routes across seven domain agents, and led it from prototype to 50 percent of first-time trial customers as tech lead. I use agentic development tools day to day, so bringing Claude Code into your workflow is natural rather than new.

I would welcome the chance to help build the lifecycle-orchestrator service, and I thank you for your time and consideration.

Sincerely,

Krishnakumar Ramesan
