Nextdoor Hiring Team
Nextdoor
San Francisco, CA

Dear Nextdoor Hiring Team,

I am excited to apply for the Software Engineer role at Nextdoor. Building technology that fosters real local community across more than 350,000 neighborhoods is a mission I would be glad to put my backend experience behind, and your AI-first engineering culture matches how I already work. Over the last few years I have shipped flexible backend systems at scale and led an AI product from prototype to production, using the same languages and tools your team relies on.

At Intuit, I designed and shipped a production multi-agent AI onboarding assistant for QuickBooks on LangGraph and OpenAI GPT 4.1, driving it from a hackathon prototype to serving 50 percent of first-time trial customers as tech lead. I built a config-driven orchestrator that routes each message across seven domain agents, grounded in a screen-context engine that reads the live DOM with on-page redaction of sensitive data. On the same team I owned a fault-tolerant fulfillment pipeline on Kafka, ingesting hundreds of thousands of events per day and scaled to 75 TPS through database partitioning and sharding. I use Claude and similar tools daily and take full ownership of what they produce.

Earlier at TriNet, I built backend services that many teams depended on. I delivered an ACL-based authorization service consumed by 20 microservices, backed by a two-tier Redis cache that removed per-request database round-trips and cut p90 latency on a hot path hit by every API request. I also built the core SSO microservice serving roughly 400,000 customers across about 20 provider integrations. Across both roles I have worked in Kotlin, Python, GraphQL, Postgres, Redis, Kafka, and AWS, which is the stack your team builds on.

I do my best work in ambiguous, fast-moving environments where I can own a problem end to end, from shaping the idea to measuring its impact. I am based in the Bay Area and happy to work in a hybrid model out of your San Francisco office. I would welcome the chance to talk about how I can help build the systems Nextdoor's neighbors rely on, and I thank you for your time and consideration.

Sincerely,
Krishnakumar Ramesan
