Robinhood Hiring Team
Robinhood
Menlo Park, CA

Dear Robinhood Hiring Team,

I am excited to apply for the Senior Software Engineer, Backend role at Robinhood. Building the systems behind real-time trading and balances, where correctness and customer trust are non-negotiable, is exactly the kind of backend work I am drawn to. For more than a decade I have designed large-scale distributed systems where ordering, reliability, and latency decide whether a product can be trusted, and I would bring that same discipline to Robinhood's core platforms.

At Intuit, I owned a fault-tolerant event pipeline ingesting hundreds of thousands of events per day, built around idempotent consumers, ordered delivery, and safe recovery under partial failures, and scaled it to 75 TPS through database partitioning and sharding. Ordering was a hard correctness constraint, since each event had to be linked to its upstream entities before it could be published. I also diagnosed a production 30-second API timeout and brought it down to 785 milliseconds, a 97 percent reduction, by profiling query patterns and removing redundant round-trips, overfetching, and missing indexes. Alongside this I led a multi-agent AI product from prototype to production as tech lead, the kind of large, ambiguous project this role centers on.

Earlier at TriNet, I built backend services that sat on the hot path of every API request. My ACL-based authorization service, used by 20 microservices, removed per-request database round-trips with a two-tier cache and measurably cut p90 latency under production load. I also built the core SSO service for roughly 400,000 customers, and an audited event-bridge between an on-premise HR engine and new microservices that used write-ahead logging as a replay buffer, so failed events could be recovered and corrected without data loss. Getting reliability and auditability right at that scale shaped how I think about financial-grade correctness.

Across these projects I have led technically complex work end to end and mentored engineers through design and code reviews. I am based in the Bay Area and happy to be in your Menlo Park office the expected days each week. I would welcome the chance to talk about how I can help build the platforms Robinhood's customers depend on, and I thank you for your time and consideration.

Sincerely,
Krishnakumar Ramesan
