Interface.ai Hiring Team

Interface.ai

San Francisco, CA

Dear Interface.ai Hiring Team,

I am excited to apply for the Senior Software Engineer role at Interface.ai. A universal banking assistant that transacts across institutions and can autonomously drive someone's financial goals is exactly the kind of agent system I build. I have shipped production multi-agent AI on frontier OpenAI models inside a fintech product used by millions, the rare combination of research-grade AI and consumer impact this role offers, and I would bring that straight to BankGPT.

At Intuit, I designed and shipped a multi-agent AI onboarding assistant for QuickBooks on LangGraph and OpenAI GPT-4.1, taking it from prototype to production as tech lead, where it now reaches half of all first-time trial customers. I built a config-driven orchestrator that classifies each user message and routes it across seven domain agents that act, hand off, or answer from context, which is the multi-model orchestration and agent-runtime work this role centers on. I also built the engine that grounds those agents in what the user is doing on screen, converting the live DOM into compact structured context with on-page redaction of sensitive data, replacing a roughly 9-second screenshot-plus-vision pipeline with a 30-millisecond parse. That is close cousin work to a Computer Use engine, and I own these systems end to end, setting their direction and mentoring the engineers on them.

The banking domain rewards getting reliability and data security exactly right, which is where most of my career has been spent. I owned a fault-tolerant, real-time event pipeline ingesting hundreds of thousands of events per day with idempotent consumers and ordered delivery, scaled to 75 TPS, and I cut a production API path from 30 seconds to 785 milliseconds, a 97 percent reduction. Earlier at TriNet I built the core SSO service for roughly 400,000 customers, and at Intuit I secured thousands of API credentials with AES-256-GCM envelope encryption and KMS-backed key rotation.

I also work the way this team does. I took an AI product from hackathon to production, I use AI heavily in my own workflow to ship faster, and my recent work is in Python and Kotlin. I am in the Bay Area and happy to be in your office five days a week. I would welcome the chance to talk about how I can help build BankGPT, and thank you for your time.

Sincerely,
Krishnakumar Ramesan
