Commercial & Investment Bank Hiring Team
JPMorgan Chase
Palo Alto, CA

Dear Hiring Team,

I'm applying for the Backend Java Software Engineer III role on the Digital Enablement team. For 13+ years I've built secure, scalable backend microservices in Java and Kotlin, and most recently shipped a production multi-agent AI system, which lines up closely with what this role asks for: trusted, high-quality production code and practical AI/ML integrated into real applications.

At Intuit I designed and shipped a production multi-agent AI onboarding assistant for QuickBooks on LangGraph and OpenAI GPT 4.1, taking it from hackathon prototype to production as tech lead and ramping it to 50% of first-time trial customers. I built a config-driven intent orchestrator that classifies each message and routes across 7 domain agents, plus a screen context engine that replaced a 9-second screenshot-and-vision pipeline with a 30 ms DOM parse. That experience covers the agentic frameworks and production ML integration listed as preferred qualifications, grounded in concrete mechanics rather than buzzwords.

The same role at Intuit also kept me deep in the backend fundamentals this team needs. I owned a fault-tolerant fulfillment subsystem ingesting hundreds of thousands of events per day from 4 sales channels, designed for idempotent consumers and ordered delivery, and scaled it to 75 TPS through database partitioning, sharding, and load-based autoscaling. I cut a production query path from 30 seconds to 785 ms, a 97% reduction, by profiling and removing redundant round-trips and missing indexes. On the security side I encrypted thousands of carrier API credentials with AES-256-GCM envelope encryption via AWS KMS, with 30-day root key rotation and mTLS in transit.

Earlier at TriNet I built core identity and event infrastructure for a regulated environment, namely an ACL-based authorization service consumed by 20 microservices and an SSO service serving roughly 400K customers across 20 SAML integrations. Working on financial-grade systems where security, resiliency, and auditability are first-class concerns is exactly the kind of engineering I want to keep doing, which is why J.P. Morgan's Commercial & Investment Bank is a strong fit.

I'd welcome the chance to bring this mix of backend depth and applied AI to your team.

Sincerely,
Krishnakumar Ramesan
