Samsara Hiring Team

Samsara

Remote (US)

Dear Hiring Team,

I'm applying for the Senior Software Engineer role on the Route Execution team. Tracking and executing hundreds of thousands of routes in real time, with a dispatch state machine that has to stay correct under failure and a flood of TMS/ERP events, is squarely the kind of distributed system I've spent my 13+ years building.

The closest match to your route-execution work is a fault-tolerant fulfillment subsystem I own at Intuit. It ingests events from 4 channels at hundreds of thousands per day, and because each event must be linked to upstream entities before downstream consumers act on it, ordering and exactly-once handling are core design constraints, the same correctness bar a dispatch state machine demands. I built it for idempotent consumers, ordered delivery, and safe recovery under partial failures, then scaled it to sustain 75 TPS through partitioning, sharding, and autoscaling. When a related bulk-matching query timed out at 30 seconds, I profiled the access patterns and brought it down to 785 ms, a 97% reduction.

Earlier, at TriNet, I built an audited event-bridge connecting an on-premise HR engine to new microservices, processing 300 to 400K events per day with write-ahead logging as a replay buffer so nothing was lost when a downstream call failed. I paired it with an admin dashboard that let support query, correct, and resubmit failed events with a full audit trail, which is the single-pane-of-glass operator tooling dispatchers and fleet managers need to run their day. I design real-time pipelines for the operators who live in them, not just for the happy path.

Your stack is Go, GraphQL, and TypeScript/React. My recent backend work is in Kotlin, Java, and Python, I've built GraphQL APIs with Netflix DGS, and I've shipped operator-facing web tooling end to end, so I'll ramp on Go quickly and contribute across the stack. I care most about shipping features customers use immediately and iterating from their feedback.

I'd welcome the chance to talk about how I can help build the next generation of route execution at Samsara.

Sincerely,
Krishnakumar Ramesan
