Casca Hiring Team

Casca

San Francisco, CA

---

Dear Casca Hiring Team,

I am excited to apply for the Software Engineer role at Casca. Replacing decades-old banking systems with AI that automates the manual work is exactly the kind of problem I want to be working on. I recently designed and shipped a production multi-agent AI assistant on OpenAI models inside a fintech product, and I pair that with more than a decade of building reliable backend systems where money and identity are on the line.

I lead from the front and take pride in owning components end to end. At Intuit I took a multi-agent AI onboarding assistant from hackathon prototype to production as tech lead, where it now reaches half of all first-time trial customers. I also think hard about scope. When the team was grounding agents with a screenshot-plus-vision pipeline that cost roughly 9 seconds per turn, I replaced it with a 30-millisecond DOM parse by trading away on-screen imagery the use case did not actually need. Finding the simplest path to the core value, rather than building complexity for its own sake, is how I prefer to ship.

I also hold a high quality bar in production. I owned a fault-tolerant event pipeline with idempotent consumers and ordered delivery, scaled it to 75 TPS through Postgres partitioning and sharding without over-building for traffic we did not have, and cut a production API path from 30 seconds to 785 milliseconds by profiling queries and fixing missing indexes. I back this work with automated testing, including an integration test stub that let QE run full regression suites on demand and decoupled our releases from third-party availability.

My recent work is in Python with Postgres on AWS, which lines up with your stack, and I am comfortable picking up the TypeScript and React side as I go. The startup intensity you describe is the environment I want, and I am already in the Bay Area. I would welcome the chance to talk about how I can help build Casca, and thank you for your time.

Sincerely,

Krishnakumar Ramesan
